

Network Administration/System Administration Homework #7

B10202012 劉仲楷

1 PVE

ref:

- Proxmox Installation
- KVM/QEMU 以 virt-install 指令建立虛擬機器、VNC 顯示畫面教學
- virt-install(1) - Linux man page
- Create a virtual machine in KVM using virt-install

```
1. qemu-img create -f qcow2 /tmp2/b10202012/hw7.qcow2 10G
virt-install \
--name b10202012-1 \
--vcpus 2 \
--memory 8192 \
--disk path=/tmp2/b10202012/hw7.qcow2,format=qcow2,bus=virtio \
--cdrom /tmp2/hw7/proxmox.iso \
--network bridge=br0,mac=52:54:20:20:12:01 \
--graphics vnc,listen=0.0.0.0 \
--noautoconsole \
--os-variant debian11
virsh vncdisplay b10202012-1
```

此時我看到是 :9，代表 vnc port 是 5909。用 vnc 連上後選 Install Proxmox VE (Terminal UI, Debug Mode)。

- Country: Taiwan
- Timezone: Asia/Taipei
- U.S. English
- 填 password、email

剩下都選預設。我重的時候他沒有自動開，我用了 virsh start b10202012-1。重 vnc 即可看到 IP: 192.168.141.102。再用

```
ssh root@192.168.141.102
```

即可連線。

```
b10202012@nasaws3:/tmp2/b10202012$ ssh root@192.168.141.102
The authenticity of host '192.168.141.102 (192.168.141.102)' can't be established.
ED25519 key fingerprint is SHA256:t00yItaEq36kUvNE3WCfLDF1HtnCsX0k1RvTnSZGcBc.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '192.168.141.102' (ED25519) to the list of known hosts.
root@192.168.141.102's password:
Linux b10202012 6.8.12-4-pve #1 SMP PREEMPT_DYNAMIC PMX 6.8.12-4 (2024-11-06T15:04Z) x86_64

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/*copyright.

root@b10202012:~#
```

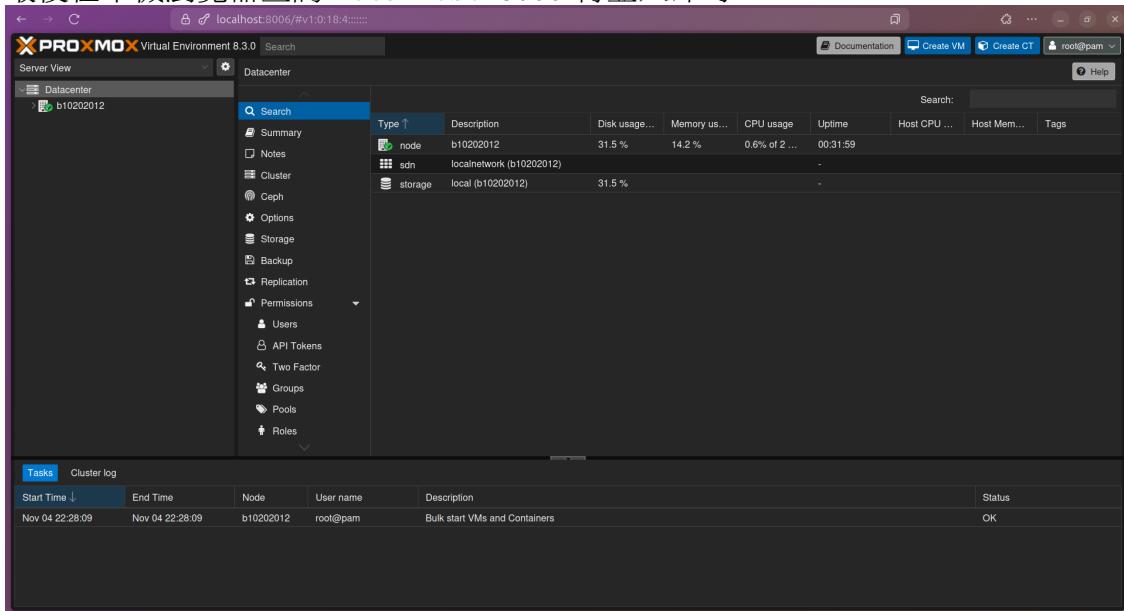

2. 如上一題所說，或是也可以在 vnc 登入後用 ip a
3. 首先在本機連線到 nasaws 的時候用下列指令 forward 工作站的 8006 到本機（如果不行就換一個 port）

```
ssh -L 8006:localhost:8006 b10202012@140.112.187.53
```

接在工作站用下列指令 forward 虛擬機的 8006 到工作站

```
ssh -L 8006:192.168.141.102:8006 root@192.168.141.102
```

最後在本機瀏覽器查詢 localhost:8006 再登入即可。

2 Create VM

ref:[proxmox: ZFS on Linux#zfs administration](#)

1. 和上一題一樣的方法新增磁碟

```
qemu-img create -f qcow2 /tmp2/b10202012/hw7-disk2.qcow2 20G
```

接用 virsh edit b10202012-1 修改 config。找到 devices 中 disk 的 block 複製一份後，將 .qcow2 file 換成上面的位置，vda 換成 vdb。例如：

```
<disk type='file' device='disk'>
  <driver name='qemu' type='qcow2' />
  <source file='/tmp2/b10202012/hw7-disk2.qcow2' />
  <target dev='vdb' bus='virtio' />
</disk>
```

然後 reboot :

```
virsh shutdown b10202012-1
virsh start b10202012-1
```

重新 ssh 連線後，用 lsblk 檢查可以看到 vdb 20G。接創建 zpool

```
zpool create -f tank /dev/vdb
```

最後可以用 zpool status 檢查。

2. 先關機 virsh shutdown b10202012-1

接一樣用 virsh edit b10202012-1 修改 config。參考 devices 中 interface 的 block 新增：

```
<interface type='user'>
  <mac address='52:54:20:20:12:02' />
  <model type='virtio' />
</interface>
```

開虛擬機、連線後，檢查 ip a 確定有連上網卡，以及找到接口名稱（enp8s0）。在 /etc/network/interfaces 新增

```
auto enp8s0
iface enp8s0 inet static
  address 10.0.2.15/24
  gateway 10.0.2.2
```

接重：systemctl restart networking 這時候我發現直接 curl 140.250.77.14 會成功，但是 curl google.com 會沒辦法 resolved，因此我用 webgui 找到 System > DNS 新增 8.8.8.8 就成功了。

3. 將之前改的 enp8s0 改成

```
auto enp8s0
iface enp8s0 inet manual

auto vmbr1
iface vmbr1 inet static
  address 10.0.2.15/24
  gateway 10.0.2.2
  bridge-ports enp8s0
```

```
bridge-stp off
bridge-fd 0
dns-nameservers 8.8.8.8
```

4. 使用以下指令將 ISO 檔放入虛擬機。

```
scp /tmp2/hw7/alpine.iso root@192.168.141.102:/var/lib/vz/template/iso/alpine.iso
```

在新增虛擬機過程中，我發現我沒辦法用 ZFS，我發現是沒將之前新增的 ZFS 加入 Datacenter，具體步驟如下：

- 點選 Datacenter > Storage > Add > ZFS
- ID 輸入 tank 剩下可以預設，按下 Create，這時候會看到左邊多了一個 database 圖示，表示 tank。

接在 webgui 上點選 Create VM 填入以下資料，沒寫的都填預設就好

- **General:** Name: alpine-b10202012
- **OS:** Use CD/DVD disc image file (ISO): ISO image: alpine.iso
- **Disks:** Storage: tank, Disk size (GiB): 8
- **Memory:** Memory (MiB): 1024
- **Network:** Bridge: vmbr1

接在左邊選單選擇 alpine-b10202012 > Console > Start Now 動，接下來要安裝 alpine。首先用 root 登入，不需要密碼。接執行

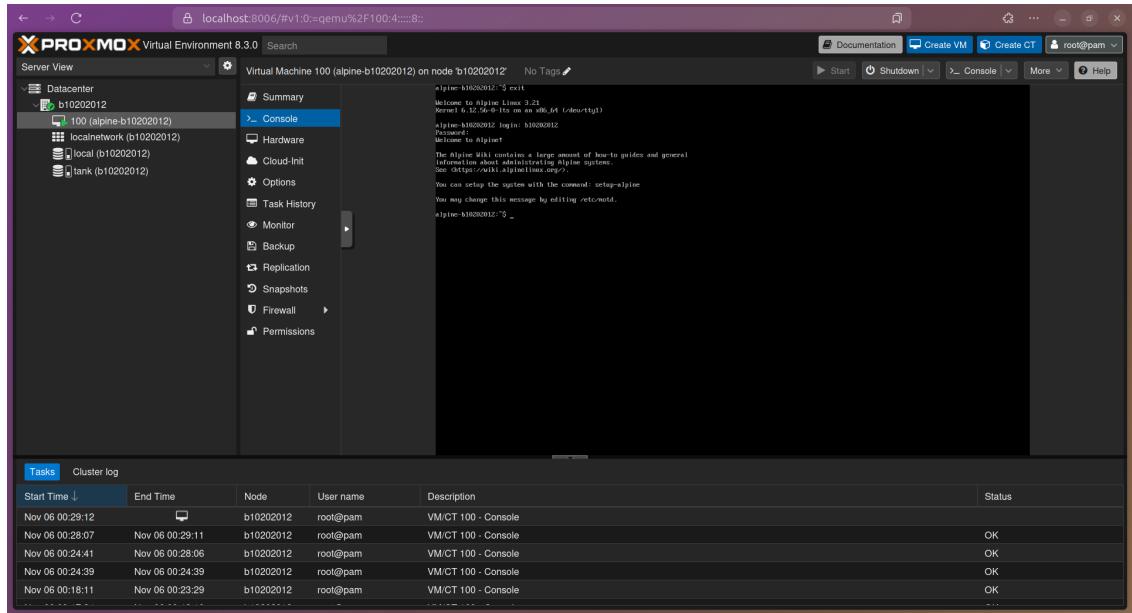

```
setup-alpine
```

- Keyboard: layout: us, variant: us
- Hostname: alpine-b10202012
- Network Configuration
 - Interface: eth0
 - Ip address: dhcp
 - Manual network configuration: n
- Reset Password
- Timezone: Asia/Taipei
- Proxy: none
- APK Mirror: 1 (find and use the fastest)
- setup user: no
 - ssh: openssh, allow root: yes, key: none
 - NTP: chrony
- Disk setup: disk: sda, how: sys, erase: y

設定完後 reboot。重後，點 Hardware > CD/DVD ... alpine.iso > Remove。

5. adduser b10202012

，設定密碼。

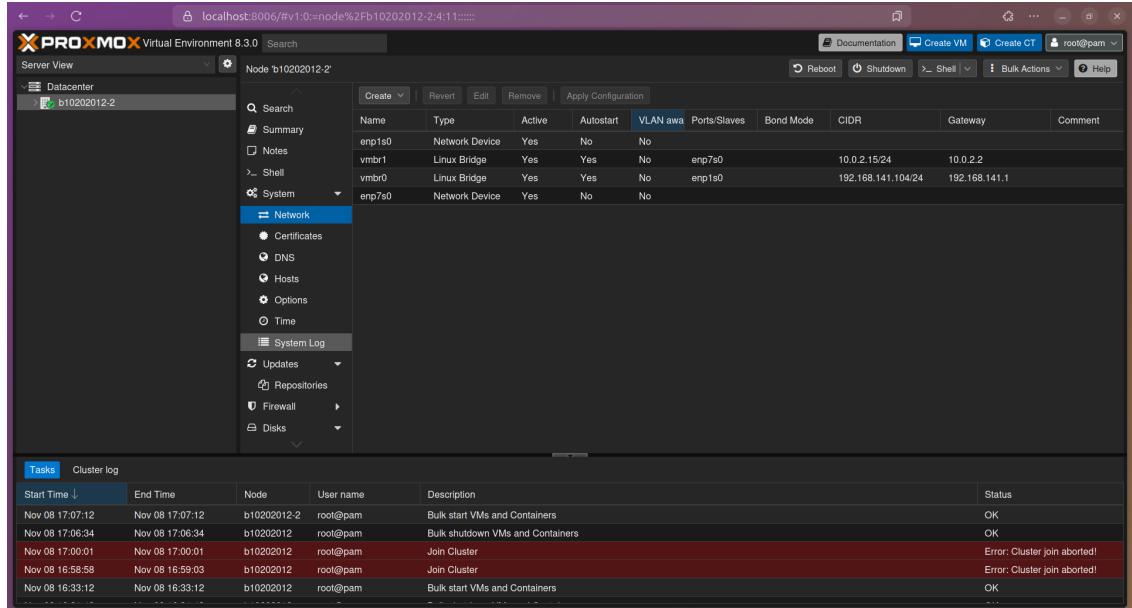

6.

3 Cluster and HA

ref: [Proxmox: Cluster Manager](#)

1. 略
2. 和前面步驟一樣，只需要更改名字、網卡編號即可。這臺的 IP 是 192.168.141.104。

3. 用以下指令在第一個 proxmox 建立 cluster :

```
pvecm create cluster-012
```

接到第二個 proxmox 加入 cluster

```
pvecm add 192.168.141.102
```

現在在 webgui 上可以同時看到兩臺虛擬機了：

The screenshot shows the Proxmox Web Interface. On the left, the 'Server View' sidebar lists 'Datacenter (cluster-012)' containing two hosts: 'b10202012' and 'b10202012-2'. The main panel displays the configuration for host 'b10202012'. Under the 'System' tab, the 'Network' section is selected, showing network interfaces: vmbr0 (Linux Bridge), enp1s0 (Network Device), and enp8s0 (Network Device). Below this, the 'Tasks' and 'Cluster log' sections show recent events. The 'Cluster log' table includes entries for joining the cluster and a bulk shutdown.

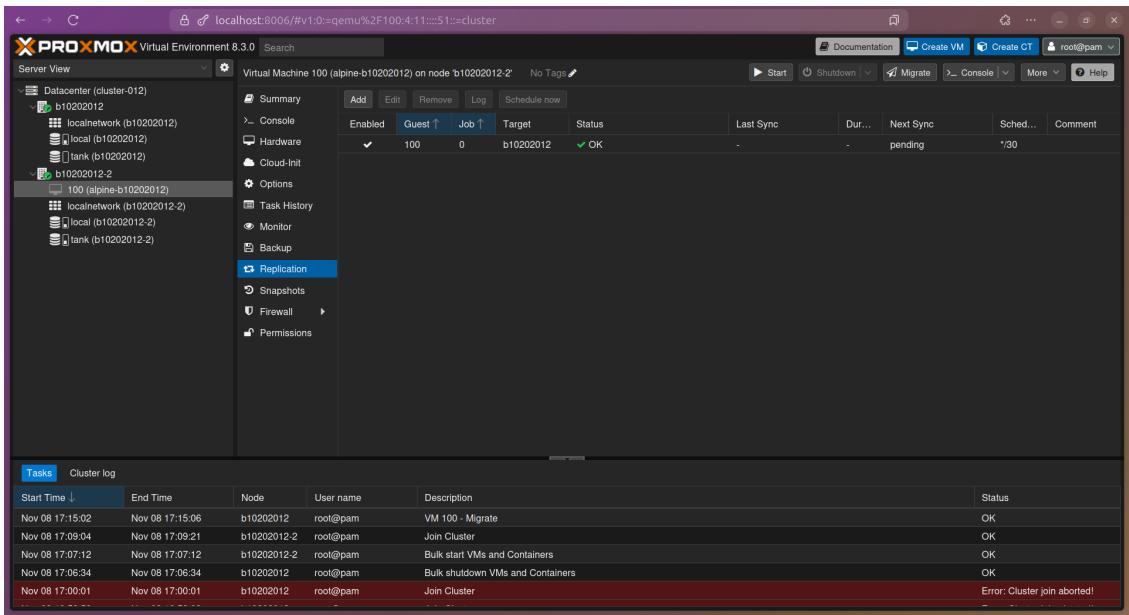

Start Time	End Time	Node	User name	Description	Status
Nov 08 17:09:04	Nov 08 17:09:21	b10202012-2	root@pam	Join Cluster	OK
Nov 08 17:07:12	Nov 08 17:07:12	b10202012-2	root@pam	Bulk start VMs and Containers	OK
Nov 08 17:06:34	Nov 08 17:06:34	b10202012	root@pam	Bulk shutdown VMs and Containers	OK
Nov 08 17:00:01	Nov 08 17:00:01	b10202012	root@pam	Join Cluster	Error: Cluster join aborted!
Nov 08 16:58:58	Nov 08 16:59:03	b10202012	root@pam	Join Cluster	Error: Cluster join aborted!

- 在 gui 上左側選單右鍵點選 alpine 虛擬機，點選 Migrate，target node 選另一臺機器。完成後即可看到：

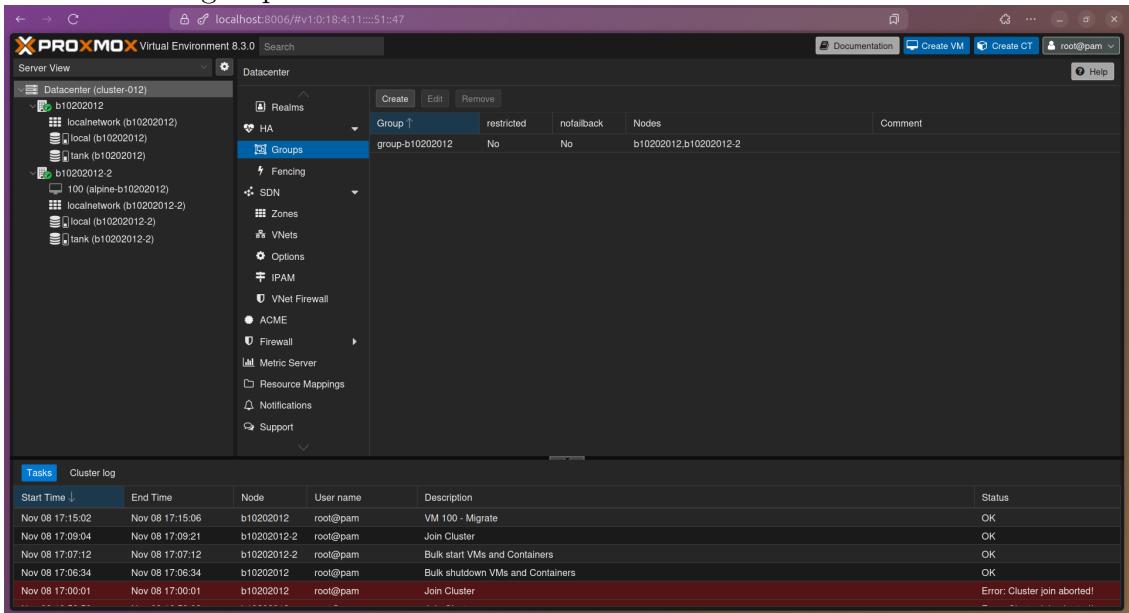

This screenshot shows the same Proxmox Web Interface as the previous one, but with a notable difference: VM 100 (alpine-b10202012) has been successfully migrated to host 'b10202012-2'. The 'Cluster log' table now includes an entry for the migration process.

Start Time	End Time	Node	User name	Description	Status
Nov 08 17:15:02	Nov 08 17:15:06	b10202012	root@pam	VM 100 - Migrate	OK
Nov 08 17:09:04	Nov 08 17:09:21	b10202012-2	root@pam	Join Cluster	OK
Nov 08 17:07:12	Nov 08 17:07:12	b10202012-2	root@pam	Bulk start VMs and Containers	OK
Nov 08 17:06:34	Nov 08 17:06:34	b10202012	root@pam	Bulk shutdown VMs and Containers	OK
Nov 08 17:00:01	Nov 08 17:00:01	b10202012	root@pam	Join Cluster	Error: Cluster join aborted!

- 在 gui 上左側選單右鍵點選 alpine 虛擬機，點選 Replication > Add Node 選另一臺、Schedule 選 30 分鐘。

- 在 gui 上左側選單右鍵點選 Datacenter > HA > Groups > Create，勾選兩個 nodes，ID 填 group-b10202012。

- 點選 alpine 虛擬機，在右上角的 More 中點選 Manage HA 。Group 選剛剛建立的 group-b10202012 。
